Part 1: 9:15-10:00 AM

- Background of development of Key Indicator Methods &
- The draft of the new Key Indicator Method “Manual Handling Operations” (KIM MHO): **Aspects of background, objectivity and reliability** (André Klusmann *et al.*)
- The draft of the new Key Indicator Method “Manual Handling Operations” (KIM MHO): **Aspects of criterion validity**. (Falk Liebers *et al.*)

Part 2: 10:30-12:00 AM

The draft of the new Key Indicator Method for ...

- Manual Lifting, Holding and Carrying Loads” (KIM LHC)
 (Patrick Serafin et al.)
- Manual Pushing and Pulling of Loads” (KIM PP)
 (Marianne Schust et al.)
- Awkward Body Postures (KIM ABP)
 (Bernd Hartmann et al.)
- Body Movement (KIM BM)
 (Hansjürgen Gebhardt et al.)
- Whole Body Forces (KIM BF)
 (André Klussmann et al.)

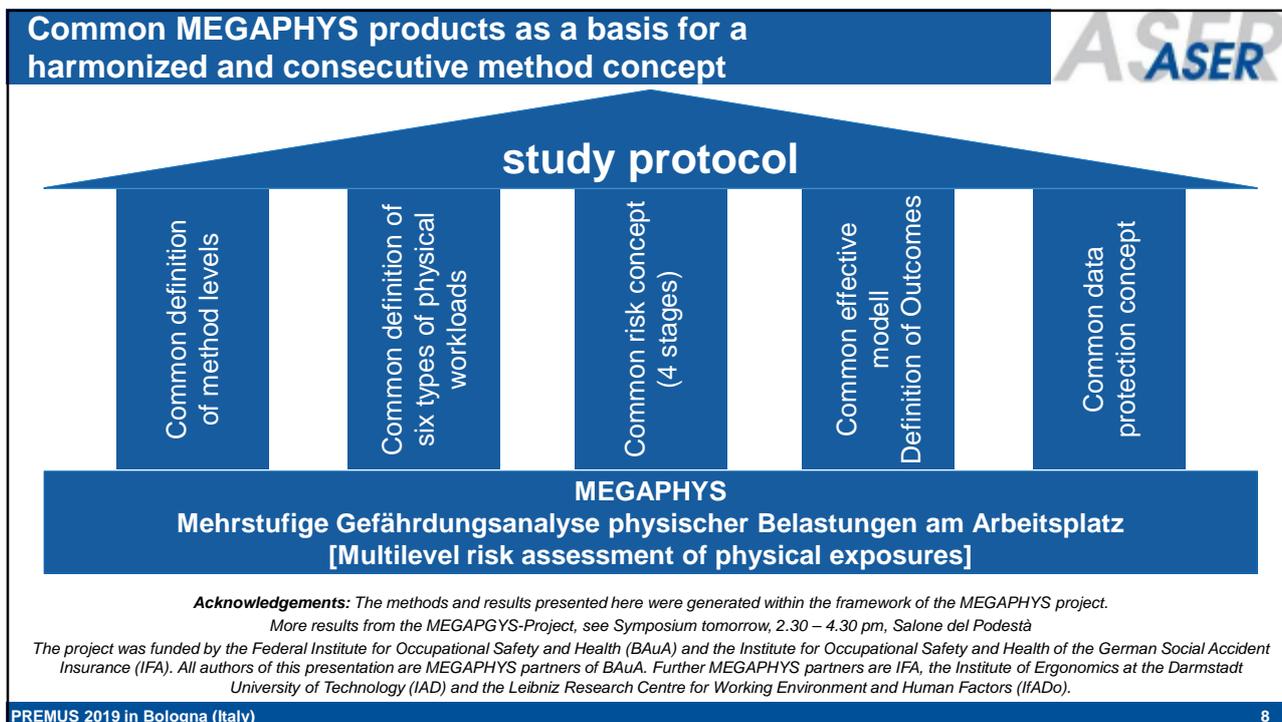

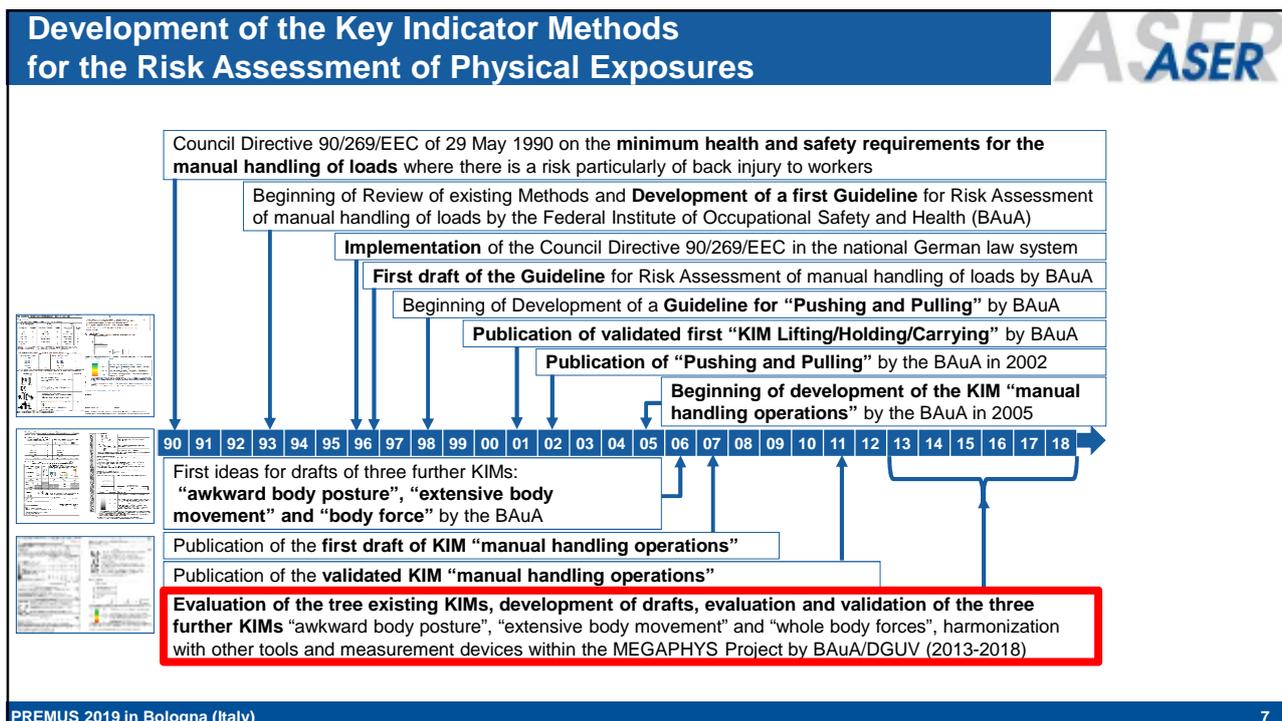

Aspects of background, objectivity, reliability and criterion validity.

What is a Key Indicator Method (KIM)?

- Key Indicator Methods (KIM) are specific screening methods for the risk assessment for different types of physical workload
- Different “indicators” (like e.g. for lifting and carrying
 - time rating
 - load weight
 - body posture and
 - working conditions)

are taken into account and an overall risk is calculated.

Validation of newly developed and redesigned key indicator methods for assessment of different working conditions with physical workloads based on mixed-methods design: a study protocol

André Klussmann*, Falk Lückert*, Felix Schwesig*, Marlene Schulz*, Daniel Hartmann*, Andrea Sime-Bobycz*, Karsten Schulz*, Barbara Jäger*, Claus Jordan*, Hans-Jürgen Goldbrunn* and the MEGAPHYS Study Group

Background: The aim of this study is to evaluate the validity of newly developed and redesigned key indicator methods for assessment of different working conditions with physical workloads based on mixed-methods design. The study is a part of the MEGAPHYS project, which aims to develop a multi-stage assessment method for physical workloads at the workplace. The study is a part of the MEGAPHYS project, which aims to develop a multi-stage assessment method for physical workloads at the workplace. The study is a part of the MEGAPHYS project, which aims to develop a multi-stage assessment method for physical workloads at the workplace.

Methods: The study is a part of the MEGAPHYS project, which aims to develop a multi-stage assessment method for physical workloads at the workplace. The study is a part of the MEGAPHYS project, which aims to develop a multi-stage assessment method for physical workloads at the workplace. The study is a part of the MEGAPHYS project, which aims to develop a multi-stage assessment method for physical workloads at the workplace.

Conclusions: The study is a part of the MEGAPHYS project, which aims to develop a multi-stage assessment method for physical workloads at the workplace. The study is a part of the MEGAPHYS project, which aims to develop a multi-stage assessment method for physical workloads at the workplace. The study is a part of the MEGAPHYS project, which aims to develop a multi-stage assessment method for physical workloads at the workplace.

Keywords: key indicator methods, mixed-methods design, physical workloads, assessment, validity, MEGAPHYS project

ASER

Validation of the KIMs within the MEGAPHYS project: Study design: working hypotheses

- The working hypotheses (WH) include the examination of different quality criteria of the KIMs
 - WH 1: The KIMs are an adequate reflection of the construct to be measured (**face validity**)
 - WH 2: At the completion of the KIMs, no relevant deviations occur between different users assessing the same workplaces (**reliability**).
 - WH 3: Assessing workplaces using the KIMs and other screening methods measuring the same type of physical workload will result in no relevant differences (**convergent validity**).
 - WH 4: It is assumed that employees at workplaces with high physical workloads show adverse health-related outcomes (e.g. musculoskeletal symptoms) more frequently than non-exposed workers. It is assumed that high-risk scores derived in the assessment of workplaces with the KIMs are associated with a high prevalence of musculoskeletal symptoms and disorders (**criterion validity or content validity regarding hypotheses testing**).

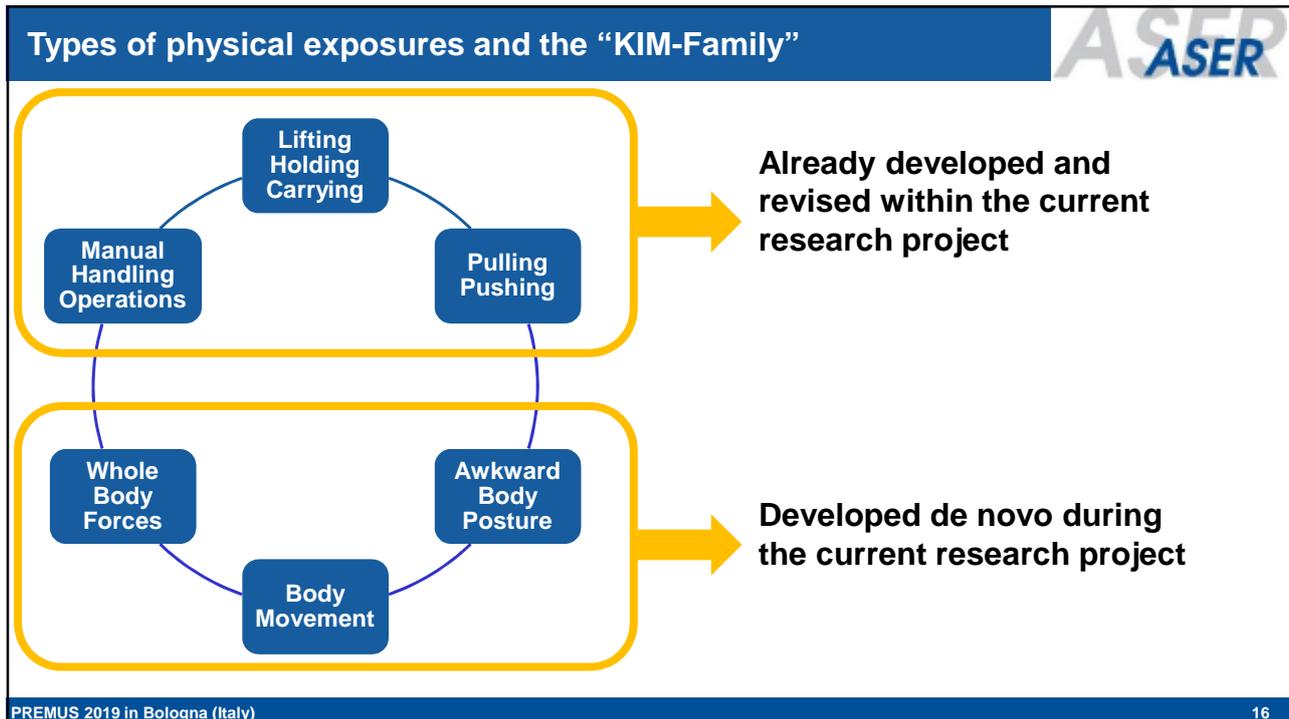

PREMUS 2019 in Bologna (Italy)
10

Study design: methods and collectives

- Cross-Sectional-Study at workplaces in voluntarily participating companies
 - For the determination of **criterion validity**, a cross-sectional study among 808 employees at 192 different workplaces was carried out.
 - Employees were interviewed (Nordic Questionnaire, WAI, COPSOQ) ... and examined by a physician (standardized diagnostic procedure).
 - Workplace analyses were done by direct observations and assessments using a standardized documentation form, KIMs, interviews, measurements (eg, noise, climate) and video recordings.
 - These workplace analyses were also used for the determination of **face validity, reliability, convergent validity, criterion validity and further aspects of utility**.
- 16 workshops with over all 85 practitioners (**reliability/objectivity**)
 - Presentation and training of the proposed method based on examples.
 - Assessment of different example tasks by several workshop participants (users) at T1.
 - Repeated assessment of the example tasks (in modified order) by the workshop participants at T2 (approx. 4 weeks later).
 - Assessment of same tasks with the proposed method by experts (reference).
 - Over all, > 1.600 assessments of work tasks with the KIMs
